

The road after the engine

Primnox V3 — Project AEGIS · V4 — Project NEXUS

V2 built the engine: the runtime, the sandbox, Graphify and the verification layer. **V3 makes that engine feel like JARVIS on one computer. V4 makes the same JARVIS follow you across every device** — without changing the runtime underneath.

V3 — Project AEGIS

Always-On JARVIS

Release theme. Primnox becomes a living assistant that thinks, acts, and keeps working — not a chat window.

Target feeling. You stop opening Primnox to ask questions. You start assigning missions.

Goals

- Always-on assistant
- Mission-based workflows
- Voice interaction
- Desktop awareness
- Multi-agent collaboration
- Visual workspace
- Human-like responsiveness

1 Mission Runtime FLAGSHIP

This replaces traditional chats. Instead of asking “*build my website*” and watching a chat scroll, Primnox creates a **Mission** with a live execution timeline.

MISSION — BUILD PRIMNOX WEBSITE

Planning	Completed
Design System	Completed
React Components	Generating — now
Testing	Queued — next

Current tool

Sandbox · Python

Current model

Capability Layer · Qwen

Needs approval

Install dependencies

A Mission survives restarts, crashes, sleep, cancellation, and being resumed later.

Mission features

- Live timeline
- ETA prediction
- Pause / resume
- Approval checkpoints
- Rollback
- Mission history

2 Agent Orchestra

Instead of one hidden model, Primnox runs specialised workers — and the user can literally watch them work.

Agent	Responsibility
Architect	Planning
Builder	Code
Designer	UI
Researcher	Documentation
Tester	Verification
Memory	Retrieval
Graph	Knowledge lookup
Security	Permission review

Builder “Generating components.”

Tester “Found failing test.”

Designer “Adjusting spacing.”

3 Desktop Awareness

Opt-in. Primnox understands the active window, selected text, clipboard, terminal, current repository and open document — so “*fix this*” already knows you are inside VS Code. No copy-paste.

4 Voice Runtime

Conversations become natural. Interruptions work. Context continues.

```
Wake word -> Whisper -> Chat runtime -> Kokoro TTS
```

5 Screen Intelligence

Beyond screenshots — Primnox builds temporary UI context: detects buttons, understands dialogs, reads errors, follows workflows. “*Why is this failing?*” needs no explanation.

6 Memory Palace

Graphify becomes visual. Instead of hidden memory, users explore people, projects, documents, decisions and preferences — and every node shows its provenance.

7 Workspace Evolution

Workspaces become living environments. A React workspace carries its live preview, terminal, documentation, graph and tasks. Everything connected.

8 Adaptive Personality Engine

Not fake emotions — behavioural adaptation. Shorter replies while coding, detailed explanations while studying, faster confirmations during execution, and it remembers your preferred terminology. Feels consistent.

Kernel additions

```
Kernel
|-- Mission Runtime
|-- Agent Orchestra
|-- Desktop Awareness
|-- Voice Runtime
|-- Screen Intelligence
'-- Workspace Engine
```

Certification

New verification packs, on top of the existing suite.

Pack	Planned tests
Voice	120
Desktop	180
Mission	250
Agents	160
Screen	140
Total additional	850+

V4 — Project NEXUS

Cross-Platform Ecosystem

Release theme. One brain. Every device.
This version turns Primnox into an ecosystem — the same runtime, different shells.

Platform	Status
Windows	Native
macOS	Native
Linux	Native
Web	PWA
Android	Native
iOS	Later

1 PrimSync FLAGSHIP

Not Dropbox. Not Drive. A dedicated synchronisation engine that syncs conversations, turns, jobs, workspaces, assets, memory, the graph, missions and settings.

Mode	Description
LAN	Direct
Cloud	Encrypted
Self-hosted	NAS
Offline	None

Everything remains optional.

2 PrimMesh

The signature feature. Instead of cloud-first, devices discover each other. Your phone asks to continue a mission; your PC streams progress, assets and logs straight to it. Peer to peer.

3 Cross-Device Missions

Start on desktop, continue on phone, finish on laptop. Mission state carries the active job, the open workspace, the selected asset and the event cursor. Nothing restarts.

4 Companion Phone

The phone becomes a command centre — approve permissions, monitor missions, continue a chat, voice control, receive alerts, approve remote execution. Like a smartwatch for your AI.

5 Browser Client

Every webpage becomes searchable: summarise it, save it as an Asset, add it to the Graph, continue a Mission from it. Not an isolated browser chatbot.

6 Universal Workspace

One workspace, many devices. Code on the desktop, review on the phone, annotate the PDF on a tablet — the same workspace throughout.

7 Shared Knowledge Graph

The graph updates everywhere. Your phone scans a receipt and your laptop immediately understands the merchant, the project and the expense. One graph.

8 Seamless Handoff

The PC sleeps, the laptop opens, and Primnox says *“Mission restored”* — exactly where you stopped.

9 Offline-first Everywhere

Every platform works offline. The internet becomes optional.

Capability	Works offline
Chat	Yes
Memory	Yes
Graph	Yes
Workspace	Yes
Assets	Yes
Sync	Later

10 Cross-Platform UI System

One design language — shared typography, spacing, animations, glass effects, icons and components. It feels identical everywhere.

Storage

Platform	Storage
Windows	SQLite
macOS	SQLite
Linux	SQLite
Android	SQLite
Web	IndexedDB

Same schema, different backend. **That is why V2's runtime matters.**

Sync security

- End-to-end encryption

- Device keys
- Trust pairing
- Encrypted relay

The cloud never needs plaintext.

Certification

Pack	Planned tests
Sync	300
Conflict resolution	180
LAN mesh	140
Offline	160
Cross-platform UI	220
Migration	90
Total new	1,090+

V3 vs V4 at a glance

Category	V3 — AEGIS	V4 — NEXUS
Theme	JARVIS runtime	Cross-platform ecosystem
Flagship	Mission Mode	PrimSync
Voice	Yes	Improved
Desktop awareness	Yes	Cross-device
Multi-agent	Yes	Shared across devices
Memory Palace	Yes	Synced
Screen intelligence	Yes	Multi-device
Workspaces	Living	Universal
Graph	Local	Shared
Sync	—	Yes
Mobile	Companion	Full client
Browser	Limited	Native client

Why the order is right

V2 builds the engine — runtime, sandbox, Graphify, verification.

V3 makes Primnox feel like JARVIS on one computer.

V4 makes that same JARVIS follow you across Windows, Linux, macOS, web and mobile, without changing the runtime underneath.

V5 can then be Digital Twin — predictive workflows and ambient intelligence — because the ecosystem foundation is already in place.

Everything in this document is planned. The test counts are targets, not measurements — the suite standing behind V2 today is 535.
